NEWS RELEASE

ISI Offers Unique Power Supply Socketing System

(Camarillo, CA) - Interconnect Systems announces a practical alternative to power supply interconnect. The ISI socketing design allows for easy power supply attach, removal, rework and replacement.

The design is a very low profile SMT with an over-molded lead frame and SLC pin /socket socketing to allow easy mate/un-mate of the power supply without any insertion/extraction tooling required. The contact is a custom, gold over nickel designed to meet low profile and extraction criteria. The power contacts are capable of carrying up to 45A. The design eliminates hard soldering and solder pooling problems.

Due to ISI's in-house design, tooling and over-molding capabilities, NRE for custom designs are surprisingly affordable and turn-around time for a first article sample is just 3 weeks. For more information visit www.isipkg.com.
